## EDUCATION

|                                                                                               |                                  |
|-----------------------------------------------------------------------------------------------|----------------------------------|
| <b>University of Wisconsin-Madison</b><br><i>Master of Science (M.S.) in Computer Science</i> | Sep 2023 – Dec 2025<br>GPA: 3.85 |
| <b>National Tsing Hua University</b><br><i>Post-Baccalaureate in Computer Science</i>         | Sep 2020 – Jan 2022<br>GPA: 3.88 |
| <b>Tunghai University</b><br><i>Bachelor of Business Administration (B.B.A.)</i>              | Sep 2014 – Jul 2018              |

## SKILLS

**Languages:** Python, Go (Golang), Java, C++, TypeScript, JavaScript, SQL  
**Frameworks & APIs:** React, Next.js, Node.js, Django, Spring, Fiber, gRPC, REST  
**Databases:** PostgreSQL, MySQL, Supabase  
**Infrastructure & Tools:** Docker, Kubernetes, Argo CD, GitHub Actions, AWS, Linux, k6

## EXPERIENCE

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                     |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| <b>NeuraSignal – Software Engineer (Contract)</b><br>Ultrasound Simulation Platform – <i>Python, C++</i> <ul style="list-style-type: none"><li>Developing collision and stochastic Doppler simulators for a research-grade medical ultrasound simulation platform on a 4-engineer team, spanning DSP, numerical validation, and automated testing</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Oct 2026 – Present  |
| <b>AI/ML platforms – Open Source Contributor</b><br>Ray, KubeRay, Apache Airflow – <i>Go, Python, TypeScript, GitHub Actions, Kubernetes</i> <ul style="list-style-type: none"><li>Merged <b>11</b> PRs across Ray, KubeRay, Apache Airflow, and Commitizen, spanning operator tests, CI automation, docs, React UI fixes, and Python CLI features</li><li>Traced up to <b>55s</b> of per-worker autoscaling delay in KubeRay to an under-provisioned init container; opened a fix that mirrors the Ray container's CPU/memory, with unit tests (in review)</li><li>Improved KubeRay CI reliability: fixed a flaky e2e test caused by 409 conflicts with the controller, and added a stale issue/PR workflow validated with dry runs on a fork</li><li>Fixed a React duplicate-key rendering bug in the Airflow web UI and migrated connection metadata to declarative YAML across <b>3</b> provider packages</li></ul> | Jan 2026 – Present  |
| <b>Digital Aid Seattle – Software Engineer</b><br>Scheduling Platform – <i>TypeScript, Next.js, Supabase (PostgreSQL/Auth/Edge Functions)</i> <ul style="list-style-type: none"><li>Built a full-stack scheduling tool that automates student grouping via timezone-aware availability matching, replacing manual spreadsheet workflows for 3 instructors</li><li>Designed multi-tenant data isolation with Supabase Row Level Security, enabling instructors to independently manage class data on a shared platform</li></ul>                                                                                                                                                                                                                                                                                                                                                                                         | May 2026 – Oct 2026 |
| <b>IBM – Software Engineer Intern</b><br>Containerization – <i>C++, gRPC, CORBA, Bash, Docker, Kubernetes, Argo CD, Linux, k6</i> <ul style="list-style-type: none"><li>Built a C++ CORBA-to-gRPC bridge that let Kubernetes health-check a closed-source legacy service used in semiconductor fabs, automating a previously manual validation workflow (~<b>60%</b> faster)</li><li>Deployed the legacy C++ services on Kubernetes with Argo CD Blue-Green GitOps releases, replacing manual deployments in the team's modernization proof of concept</li><li>Built a reusable k6 gRPC load-testing suite simulating <b>1,000+</b> concurrent users, identifying the load level at which latency spiked; demoed the end-to-end prototype to the team</li></ul>                                                                                                                                                         | Jul 2025 – Aug 2025 |

## PROJECTS

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |      |
